Yuri Soldatov — Senior Frontend / Fullstack Developer

TypeScript · React · Vue 3 · headless UI components · accessibility · 18 years in software development, 7+ in modern web.

- GitHub: github.com/youra-h
- Featured project: github.com/youra-h/soldy
- Email: manandship@gmail.com
- Location / time zone: Orenburg, Russia — UTC+5 (Yekaterinburg Time, YEKT), no daylight saving; open to remote work
- Languages: Russian (native); English — confident reading of technical docs and code, written and spoken communication mostly with the help of a translator.

Featured project: soldy

soldy is an open-source headless UI component framework: component behavior and WAI-ARIA semantics are written once in a framework-agnostic TypeScript core, and each UI framework gets a thin adapter. Author and architect; ~1,400 commits, ~590 test files.

Stack: TypeScript, React, Vue 3, Angular, Svelte, Solid, Web Components, Vite, Vitest, Playwright, Tailwind (theme package), ESLint, changesets, GitHub Actions.

What I designed and built

- **Layered architecture.** `core` (headless models) → `plugins` (DOM and lifecycle behavior) → `setup` (shared component descriptors and wiring) → `ui/*` adapters. Framework imports are allowed only in adapters, enforced by ESLint rules and tests.
- **Components:** Button, Input, Checkbox, Switch, RadioGroup, Tabs, Accordion, ListBox, Select, Tags, Slider, Popover, Tooltip, Dialog, Drawer, Calendar, DatePicker, Table and more, with compound parts (`Tabs.Item` , `Tabs.Content`).
- **Collection engine:** one engine for every list-like component, with pluggable extensions for selection, activation, ordering and drag-and-drop, plus facades that expose them to components.
- **Accessibility:** WAI-ARIA patterns, keyboard navigation, focus management, accessible names; ids built from the mount, so markup is SSR-safe.
- **Overlays:** layering, anchoring, dismiss on outside click, focus trap and scroll lock, shared by Select, Popover, Dialog and Drawer.

- **Theming:** components emit BEM classes and `data-*` attributes only; the theme is a separate package. Localization through a subtree locale provider; motion follows `prefers-reduced-motion`.
- **Quality gates in CI:** type checks per package (including Angular `ngc` with strict templates), lint rules that forbid type casts, real-browser layout tests in Chromium, and a check that published packages declare everything they import.
- **AI-agent development workflow:** analyst, tech lead, developer and designer agents work through a task board with strict project instructions (AGENTS.md).

Code to look at

What	Link
Architecture overview	docs/architecture.md
Headless core	packages/core
Behavior plugins (dismiss, overlay, table, select…)	packages/plugins/src/custom
React adapter	packages/ui/react
Vue adapter	packages/ui/vue
Table benchmark	BENCHMARKS.md, tools/bench-table

Table benchmark: 5,000 rows × 20 columns

soldy's Table now leads every Vue component library on render, memory, selection, sorting and data replacement; headless baselines without keyboard, ARIA or column resize stay lighter. In one day of profiling, first render went from 2.9 s to 1.58 s, memory from 729 MB to 288 MB and select-all from 1.7 s to 0.62 s. I built the benchmark harness myself (Vite + Playwright) to find bottlenecks, and every optimization is logged in BENCHMARKS.md.

Method: Vue 3.5, production build, Chromium, median of 3 runs, real DOM clicks, time measured until frames settle. Memory is the JS heap after render. Virtualization off; every run is verified (5,000 → 0 selected rows, correct sort order).

soldy vs Vue component libraries

Metric	soldy	Naive UI 2.45	Element Plus 2.14	PrimeVue 5.0
First render	**1.58 s**	2.45 s	9.1 s	24.9 s
Memory (JS)	**288 MB**	409 MB	580 MB	2.8 GB

Metric	soldy	Naive UI 2.45	Element Plus 2.14	PrimeVue 5.0
Select all	**0.62 s**	2.84 s	41 s	11.8 s
Clear selection	**0.54 s**	2.92 s	43 s	11.7 s
Sort	**0.96 s**	2.28 s	91 s	10.7 s
Replace data	**2.35 s**	5.65 s	60 s	11.8 s
Unmount	0.31 s	**0.27 s**	0.56 s	12.2 s
DOM nodes	**125k**	145k	235k	130k

soldy vs plain Vue and headless baselines

Baselines, not finished components: no keyboard, ARIA, column resize or reordering — only what the bench measures.

Metric	Plain Vue	TanStack Table 9	TanStack + Reka UI	soldy
First render	0.77 s	0.76 s	1.09 s	1.58 s
Memory (JS)	27 MB	39 MB	145 MB	288 MB
Select all	0.09 s	0.08 s	1.43 s	0.62 s
Clear selection	0.08 s	0.08 s	1.54 s	0.54 s
Sort	0.73 s	0.74 s	0.58 s	0.96 s
Replace data	0.84 s	1.01 s	0.81 s	2.35 s

With the optional virtualized mode, first render drops to 0.10 s and memory to 19 MB; scrolling through all rows takes 4.2 s vs 7.4 s for Naive UI and 27.3 s for PrimeVue.

Experience

Senior Frontend Developer — Muvi LLC · May 2025 – present

Nuxt, Vue 3, Pinia, Tailwind, Python / FastAPI, PostgreSQL, video streaming.

- Took over a Nuxt video client with home-made state and caching that caused unpredictable bugs and blocked framework upgrades; initiated and led a rewrite on a new stack.
- Introduced Pinia and a single API layer through the Nuxt server, with centralized request and error handling on client and server.
- Built the user account, camera pages and a live-stream video player.

- Ad detection platform for TV streams: SCTE-35 parsing from UDP multicast, scene detection with OpenCV, an ML pipeline (CLIP embeddings + FAISS similarity search + XGBoost scoring), real-time delivery via PostgreSQL NOTIFY/LISTEN and SSE.

Senior Fullstack Developer — Bortsov.Group LLC · Apr 2023 – May 2025

Cloud accounting product. TypeScript, Vue 3, AngularJS, PHP 7–8 (Yii), PostgreSQL, Redis, Docker.

- Initiated the new client app: compared stacks, the team chose Vue 3 + Vite + Tailwind; designed the app architecture (routing, Pinia, API layer, modules).
- Designed and built the in-house UI component library: forms, tables, modals, notifications, navigation.
- Automated form generation during a core refactor: fewer bugs, faster delivery of new forms; removed 30–90% of code in several modules.
- Optimized the heaviest SQL query from 6 s to 0.6 s; added client-side caching that cut database requests.
- Built a Vue tool that consolidated 200+ hard-coded CSS colors into a manageable palette; moved the team to Docker for local development; introduced Microsoft Copilot into internal processes; code reviews.

Fullstack Developer — freelance and contract work · Feb 2019 – May 2023

- Contributed to UI components built on Google Material Design Components (TypeScript, SCSS, webpack).
- Admin panels and features in Vue + TypeScript, browser extensions, Telegram bots, a large-scale web scraper.

Earlier experience · 2008 – 2019

Years	Company	Role	Highlights
2013 – 2019	ActivBusinessCollection LLC	Lead Developer	Designed the in-house framework and UI components for a modular debt-collection system (Delphi XE5, MS SQL), later extended at Sberbank; full-stack web platform for a betting company (PHP, Yii2, MySQL, Memcached)

Years	Company	Role	Highlights
2011 – 2013	Genes1s Intellectual Solutions LLC	Lead Developer	Led a team of 4 building a utilities CRM (Delphi, MS SQL); built its component framework on the Windows API and VCL and set the design and data-access standards; CRM for betting (PHP, ExtJS, MySQL); led 2–3 devs on e-commerce sites
2010 – 2011	EtAp LLC	Developer	Web client for remote staff access (PHP, jQuery, MS SQL); auto-dialer server for Asterisk
2008 – 2010	Hospital and 1C integrators	Software Engineer	Hospital admission and registry systems (Delphi, MS SQL); 1C:Enterprise configurations

Education

- **Orenburg State University** — Software Engineer, 2009. Diploma with honors (red diploma, highest grades).
- **College of Electronics and Business, Orenburg State University** — Technician Programmer, 2005.

Skills

Area	Tools
Languages	TypeScript, JavaScript, Python, PHP, SQL
UI frameworks	React, Vue 3, Nuxt, Angular, Svelte, Solid, Web Components
Component design	headless primitives, compound components, WAI-ARIA, keyboard and focus management, theming, i18n
Tooling	Vite, Vitest, Playwright, ESLint, changesets, Docker, GitHub Actions, Bitbucket

Area	Tools
Backend and data	FastAPI, Yii, PostgreSQL, Redis, REST integrations, SSE
AI	multi-agent dev workflows with Claude, Copilot; CLIP, FAISS, XGBoost
